

ICU at Home Setup Checklist

Recovering from a critical illness doesn't have to mean staying in a costly hospital ICU. With the right preparation, your home can be safely transformed into a hospital-grade care space. This checklist helps families in Chennai prepare before discharge.

✓ Choose the Right Space

- Quiet, well-ventilated room with enough space for a hospital bed, monitors, and equipment.
- Nearby electrical outlets with safe wiring; keep floor clear for nurses and equipment.

✓ Power & Oxygen Backup

- Ensure a stable power supply or UPS/inverter for ventilators and monitors.
- Arrange secure oxygen cylinders or concentrators with backup supply if needed.

✓ Sanitation & Infection Control

- Clear clutter; sanitize surfaces before setup.
- Keep hand hygiene products and PPE available.
- Limit visitors and maintain a no-shoes area if possible.

✓ Equipment & Monitoring

- Prepare ICU-grade devices: ventilators, monitors, infusion pumps, suction units.
- Confirm 24/7 tele-ICU monitoring with your provider.

✓ Nurse Workstation

- Allocate a side table for medication prep and documentation.
- Provide lighting and a chair for the nurse.

✓ Emergency Plan

- Keep emergency contacts visible (ambulance, doctor, Jupiter 24/7 line).
- Ensure a clear path to exit if urgent hospital transfer is needed.

A properly prepared space ensures safe ICU care at home, reduces infection risks, and saves up to 60% vs hospital ICU.
