

Complete Guide to Safe Tracheostomy Care at Home — Chennai Edition

Why Home Tracheostomy Care Matters

A tracheostomy allows patients with breathing difficulties to recover and live safely at home. However, improper care can lead to **infections, tube blockages, breathing emergencies, and costly re-hospitalisations**. With the right preparation, families can confidently manage tracheostomy at home while ensuring patient comfort and safety.

Essential Supplies Checklist

- Sterile suction catheters & suction machine
- Normal saline / sterile water
- Gloves & PPE
- Gauze pads, trach dressings, stoma cleaning solution
- Humidification system (nebuliser/humidifier)
- Spare tracheostomy tube & inner cannula
- Oxygen source (if prescribed)
- Emergency decannulation kit (obturator, spare ties)

Tip: Keep all supplies organised in a clean, dedicated tray or box.

Daily Care Routine

1. **Hand Hygiene First** — Wash with soap & water or use alcohol rub before and after touching the trach site.
2. **Inspect the Stoma** — Look for redness, swelling, pus or foul odour.
3. **Clean the Site** — Use sterile saline to gently clean skin and remove secretions.
4. **Change Dressing** — Keep area dry and protected to avoid irritation.
5. **Suction Secretions** — Only when needed, using sterile technique to prevent infection.
6. **Check Tube Patency** — Ensure air flows freely; replace inner cannula as prescribed.
7. **Humidify Airway** — Use humidifier/nebuliser to prevent thick secretions.
8. **Secure the Tube** — Make sure ties are snug but not too tight.
9. **Record Vitals & Secretion Amount** — Track breathing effort, SpO₂ and any changes.

Early Warning Signs — When to Call for Help

- Increased breathing difficulty or noisy breathing
- Sudden bleeding around stoma
- Fever, foul-smelling secretions, pus
- Tube displacement or accidental removal
- Blue lips/nails or low oxygen saturation

If any occur: **Call Narpavi Homecare 9790016097 immediately** or seek emergency care.

Infection Control Tips

- Always follow **WHO Hand Hygiene** before and after care.
- Use **sterile catheters & clean gloves** for suction.
- Avoid touching the tube opening with bare hands.
- Replace humidifier water daily.
- Keep patient's head slightly elevated when resting.

Why Choose Professional Support

Even well-trained families may need help. **Narpavi Homecare's tracheostomy-trained nurses:**

- Follow **doctor-led protocols** & WHO infection prevention standards.
- Provide **24×7 emergency escalation** and hospital backup.
- Offer **daily digital logs & WhatsApp updates** for local and NRI families.
- Help reduce **hospital readmission rates & infection risks**.
